

The Weather

You may use the free service [OpenWeatherMap.org](https://openweathermap.org) to bring weather data into for use with camera text overlays. Find Free Access on the Price page and use key button to get an API key via email:

Once you obtain and enter this API into Blue Iris, it may take several minutes to become active on the weather site.

You may choose values to be provided in Imperial units (°F), Metric units (°C), or “standard” units (Kelvin).

A number of macros (050-064) will become available to you for camera overlays. For your convenience, use the **conditions** box to define macro 050 using the other weather macros. This is also much more efficient when compared to retrieving and displaying each weather component individually.

For example, the default 051, 052, 053°, 060%*hum*, *wind* 057 064 m/s to **United States of America, few clouds, 49°, 49% hum, wind 17 NE** using the geographic center of the USA at the time of this writing. You may want to add unit names to this field such as °C for the temperature and km/h for the wind.

Use the **Update (min)** field to set up automatic refresh after a specified number of minutes has elapsed. Use the recycle icon to update immediately.
